Conclusions

**MVIRI** : **M**eteosat **V**isible and **I**nfra **R**ed **I**mager

- ▶ 1 image every 30 minutes
- ▶ 3 spectral channels:  
visible (VIS), water vapour (WV), infra red (IR)

**Figure :** *Normalized spectral response curves for MVIRI channels (given here are the curves for Meteosat-7)*

# Meteosat First Generation (MFG)

Aging model for  
MFG VIS band

Ilse Decoster et al.

Introduction  
MFG programme  
Calibration

Aging model

Methodology

Validation

Conclusions

Long data records: **climatology**

⇒ EUMETSAT created Climate Monitoring Satellite Application Facility (CM SAF) in 1999

Usefulness of

- ▶ Fundamental Climate Data Records (FCDRs)
- ▶ Thematic Climate Data Records (TCDRs)  
aerosol, precipitation, albedo, cloud properties, etc.

Global Climate Observing System (GCOS) setting limits on  
e.g. stability of DRs

⇒ Calibration: good and consistent over entire record!

# Calibration of VIS channel

Aging model for  
MFG VIS band

Ilse Decoster et al.

Introduction

MFG programme

Calibration

Aging model

Methodology

Validation

Conclusions

Current EUMETSAT calibration method for VIS band:  
constantly increasing calibration coefficient in time

Figure : Calibration coefficient Meteosat-7 (Govaerts et al. 2004).

Validation of this method: in-flight change of the spectral response with stronger degradation effect for shorter wavelengths: **spectral darkening**

# Spectral darkening

Aging model for  
MFG VIS band

Ilse Decoster et al.

Introduction

MFG programme  
Calibration

Aging model

Methodology

Validation

Conclusions

Probable reason of degradation process of the visible channel:

- ▶ Instruments in space: **outgassing** of lightweight molecules (moisture, lubricants, adhesives, etc.)
- ▶ Outgassed material **condenses** onto surface of the mirrors of the instruments
- ▶ When material is exposed to UV-radiation from Sun: **photodeposition** on the mirrors
- ▶ On top, energy from Sun changes optical properties of deposited material

Result: stronger absorption in shorter VIS wavelengths than in longer:

**spectral darkening**

# Selecting stable targets

To model the parameters, different targets in the Meteosat FOV are needed

- ▶ Both cloudy and clear-sky targets
- ▶ Clear-sky targets:
  - ▶ Need clear-sky images: every 10 days pixel to pixel analysis of series of 30 images before and 30 images leads to clear-sky image (Ipe et al. (2003))
  - ▶ Different scene types used: bright vegetation, dark vegetation, bright desert, dark desert and ocean
- ▶ Look for **stable sites**:
  - ▶ stable clear-sky sites have lowest standard deviation in the total series of images
  - ▶ stable cloudy sites are chosen amongst the highly convective clouds, so the highest reflectance values

# Selecting stable targets

Aging model for  
MFG VIS band

Ilse Decoster et al.

Introduction

Aging model

Methodology

Time series

Results

Validation

Conclusions

Find parameters  $(\alpha, \beta, \gamma)$  that minimize variance of time series:

1. Simulate the spectral radiance  $L(\lambda)$  for different surface types and cloudiness
2. Set the model parameters  $(\alpha, \beta, \gamma)$  to an initial value
3. Calculate  $L$  and  $L_{BB}$  with the given parameter values
4. Convert the simulated radiances into reflectances
5. Do the NB to BB conversion, fitting the  $a$  and  $b$  values for these simulated reflectance values
6. Use the values for  $a$  and  $b$  from this conversion to convert the observed reflectance  $\rho$  to broadband reflectance  $\rho_{BB}$
7. Transform  $\rho_{BB}$  to reflectance ratio  $r$

## Minimization technique (2)

Aging model for  
MFG VIS band

Ilse Decoster et al.

Introduction

Aging model

Methodology

Time series

Results

Validation

Conclusions

### 8. Minimize the variance

$$\sum_{i=1}^6 w_i \left( \frac{1}{N} \left( \sum_{j=1}^N r_{ij}^2 - \frac{\left( \sum_{j=1}^N r_{ij} \right)^2}{N} \right) \right)$$

using the method of Powell et al. (1964) and using these  $r$  values.

9. If the cost function does not lead to the optimal solution, the Powell method returns a new set of  $(\alpha, \beta, \gamma)$  parameters and the routine goes back to step 3.

### ABSTRACT

Since more than 30 years, the Meteosat satellites are in a geostationary orbit around the Earth. Due to the high temporal frequency of the data and the long time period, this database is an excellent candidate for Fundamental Climate Data Records (FCDRs). One of the prerequisites to create FCDRs is an accurate and stable calibration over the full data period. Due to the presence of contamination on the instrument in space, a degradation of the visible band of the instruments has been observed. Previous work on the Meteosat First Generation satellites, together with results from other spaceborne instruments, lead to the idea that there is a spectral component to this degradation. This paper describes the model that is created to correct the Meteosat-7 VIS channel for these spectral aging effects. The model assumes an exponential temporal decay for the gray part of the degradation and a linear temporal decay for the wavelength-dependent part. The effect of these two parts of the model is tuned according to three parameters. 253 clearsky stable Earth targets with different surface types are used together with deep convective cloud measurements to fit these parameters. The validation of the model leads to an overall stability of the Meteosat-7 reflected solar radiation data record of about  $0.66 \text{ W m}^{-2} / \text{decade}$ .

## Next steps ...

Aging model for  
MFG VIS band

Ilse Decoster et al.

Introduction

Aging model

Methodology

Validation

Conclusions

- ▶ The model is being applied to rest of MFG, but countering lots of difficulties (volcanic eruptions in data, time series too short to get parameters or do deseasonalization, etc.)
- ▶ Getting more data from EUMETSAT, use the ADC, XADC, IODC to extend databases
- ▶ Check applications of new model for GERB-like data, aerosols, surface albedo, etc.
- ▶ Full MFG database will be reprocessed by 2015, using this model to correct for degradation of the VIS channel
